Developer Productivity Toolkit

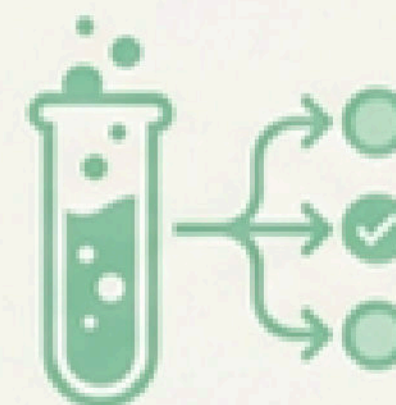

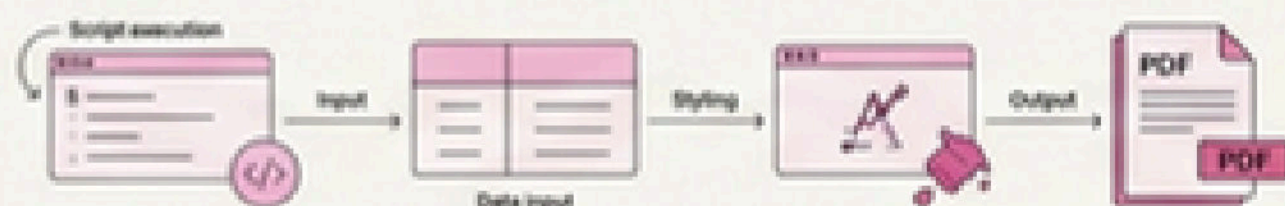

Automated Asset Generation & Flaky Test Management

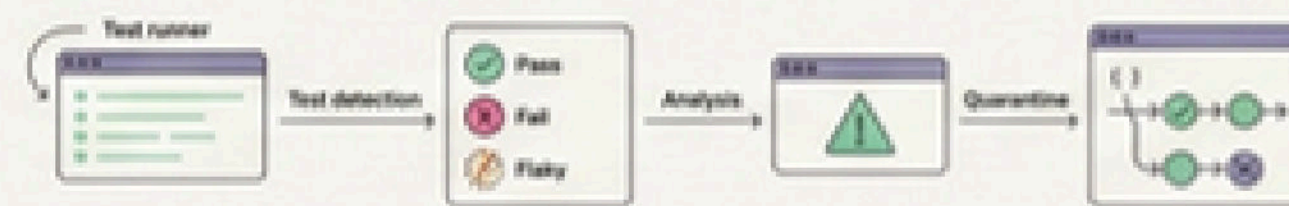

Digital Product PDF Generation

Executing local and cloud scripts to generate branded, beautifully styled PDF assets.

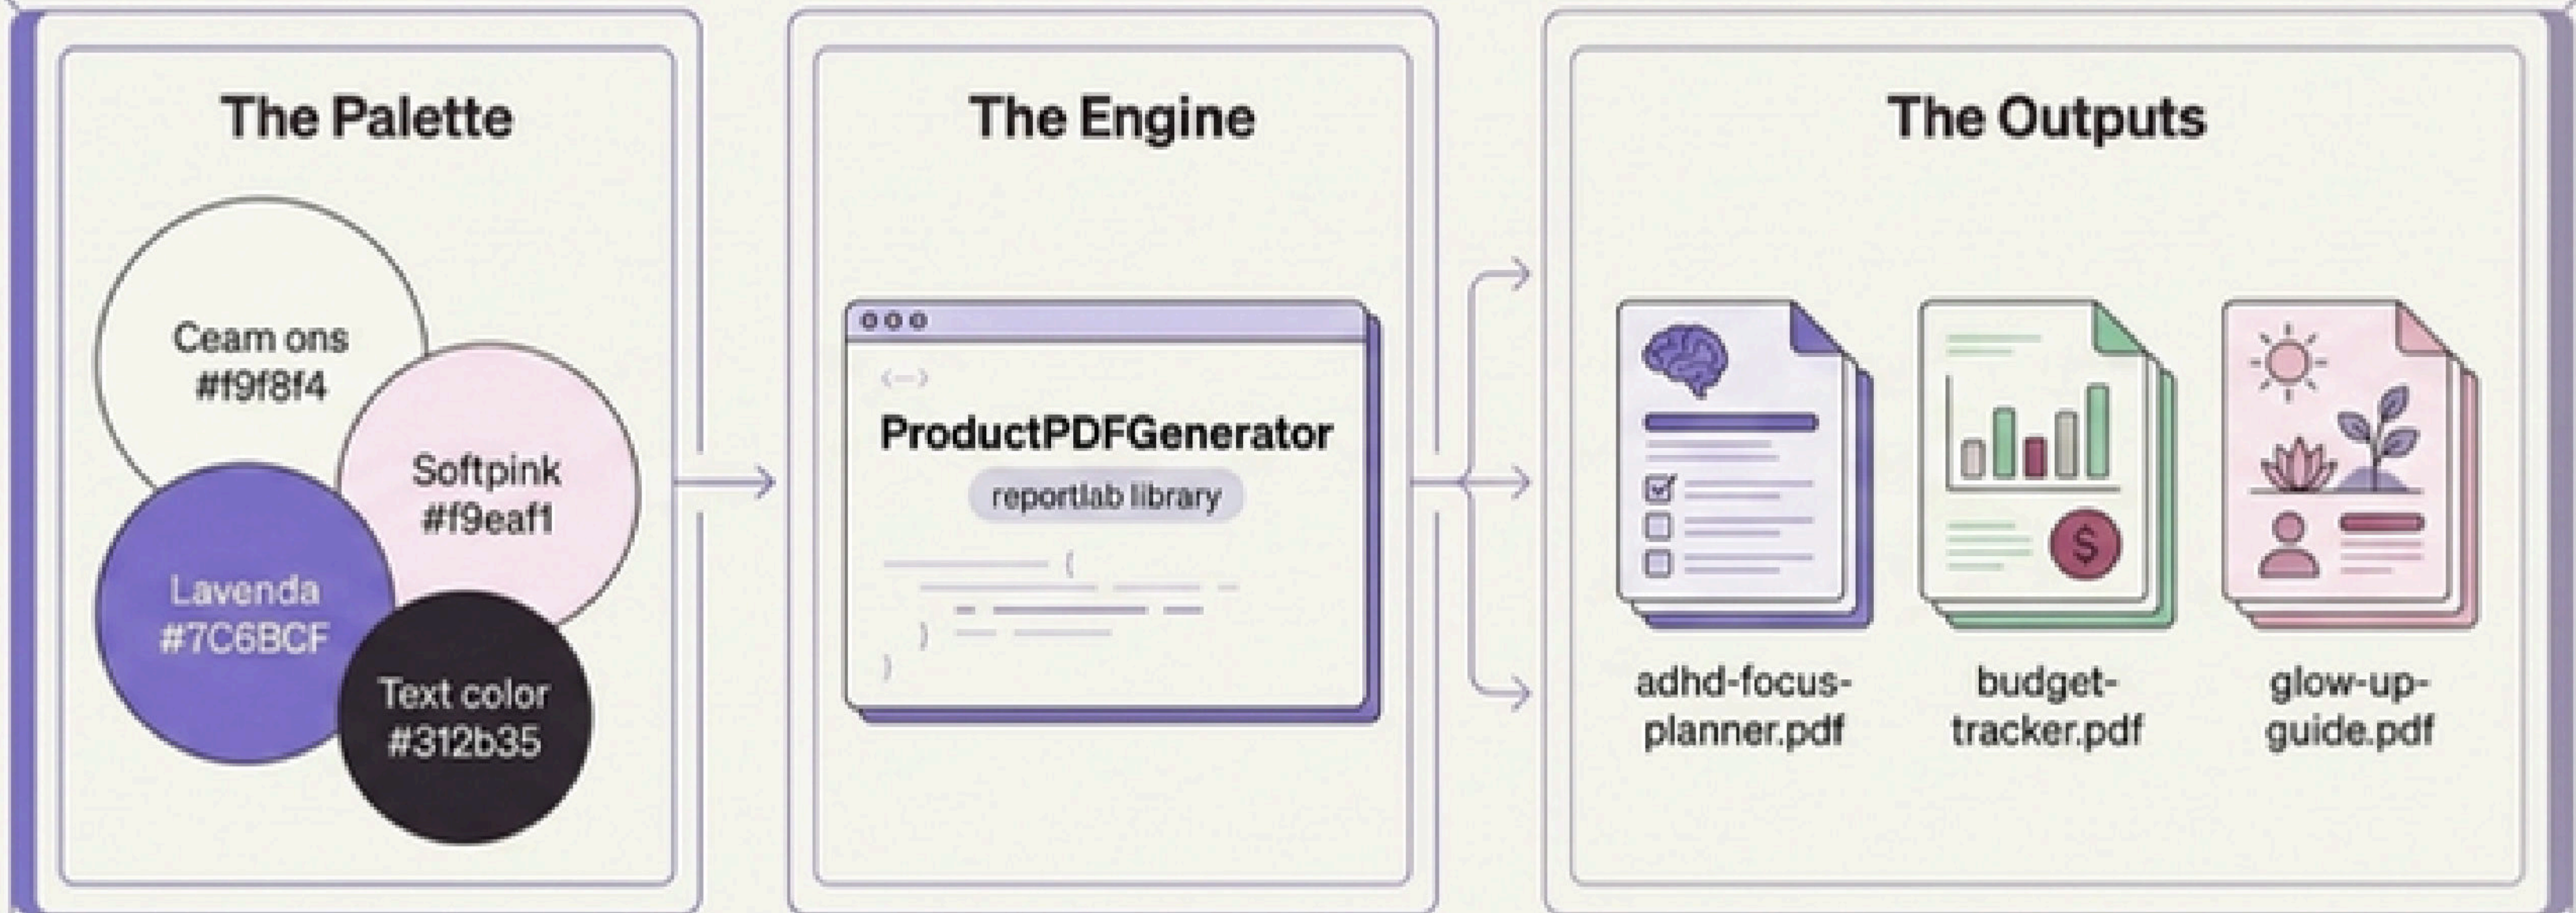

Pytest & Trunk Integration

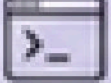

Configuring test runners to detect, analyze, and quarantine flaky tests in your CI pipeline.

Generating branded assets from Python

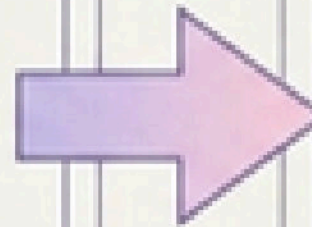

Choosing your execution environment

	 Cloud Environment	 Local Terminal
Platform	Google Colab / Replit 	macOS Terminal / Windows PowerShell 
Prerequisites	 Zero install (requires reportlab install cell) 	 Python installed locally 
Output Location	Found in the hidden /tmp/ folder 	Saved directly to the active working directory (Finder / File Explorer) 
Best For	 Quickest execution, browser-only workflows 	 Building a digital product empire from the desktop 

Optimizing paths for local execution

Before

```
if __name__ == "__main__":  
    # ... other code ...  
    output_path = "/tmp/adhd-focus-planner.pdf"  
    # ... other code ...
```

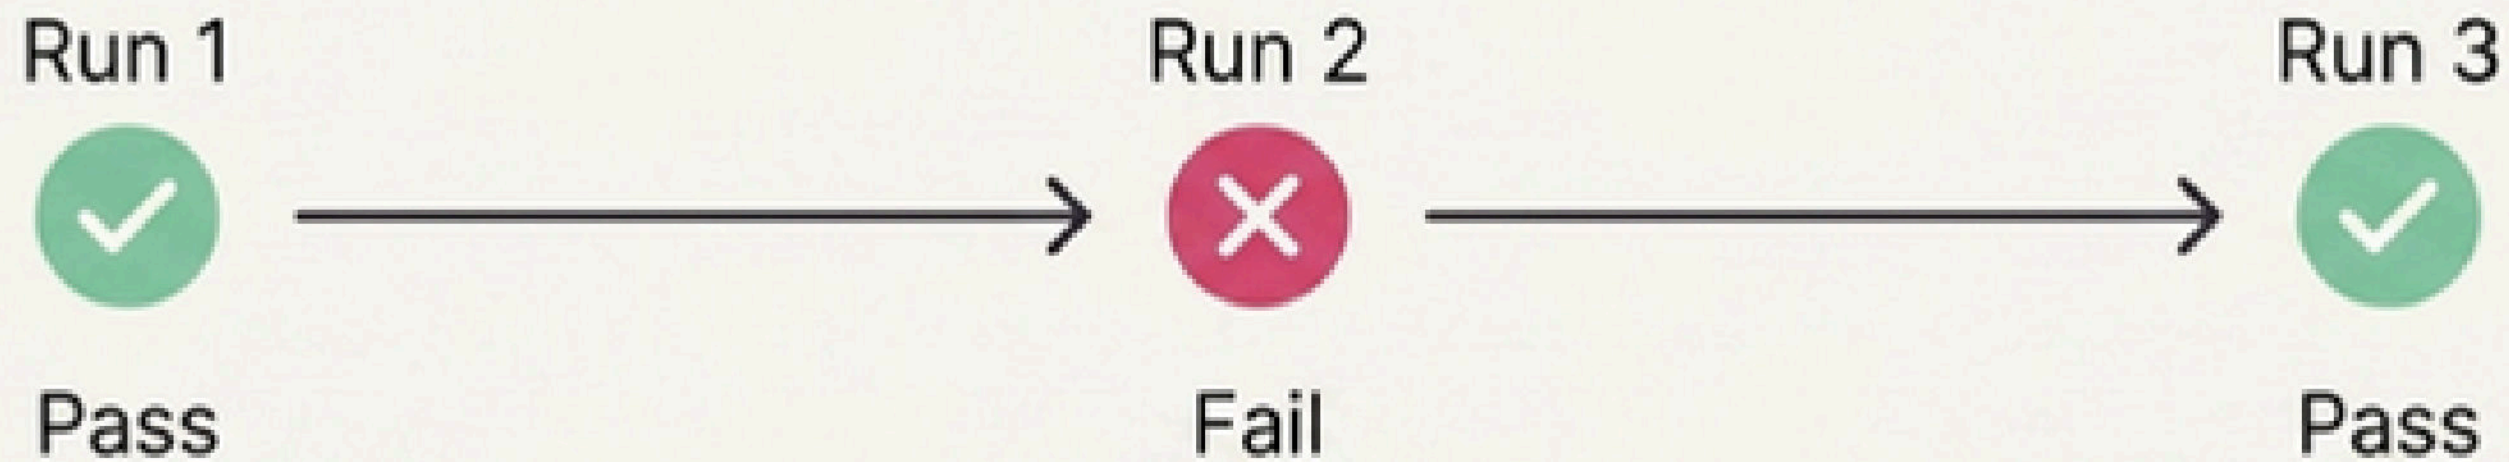

After

```
if __name__ == "__main__":  
    # ... other code ...  
    output_path = "adhd-focus-planner.pdf"  
    # ... other code ...
```

Removing the /tmp/ path ensures generated PDFs output directly into your active project folder, bypassing hidden system directories.

Identifying intermittent CI instability

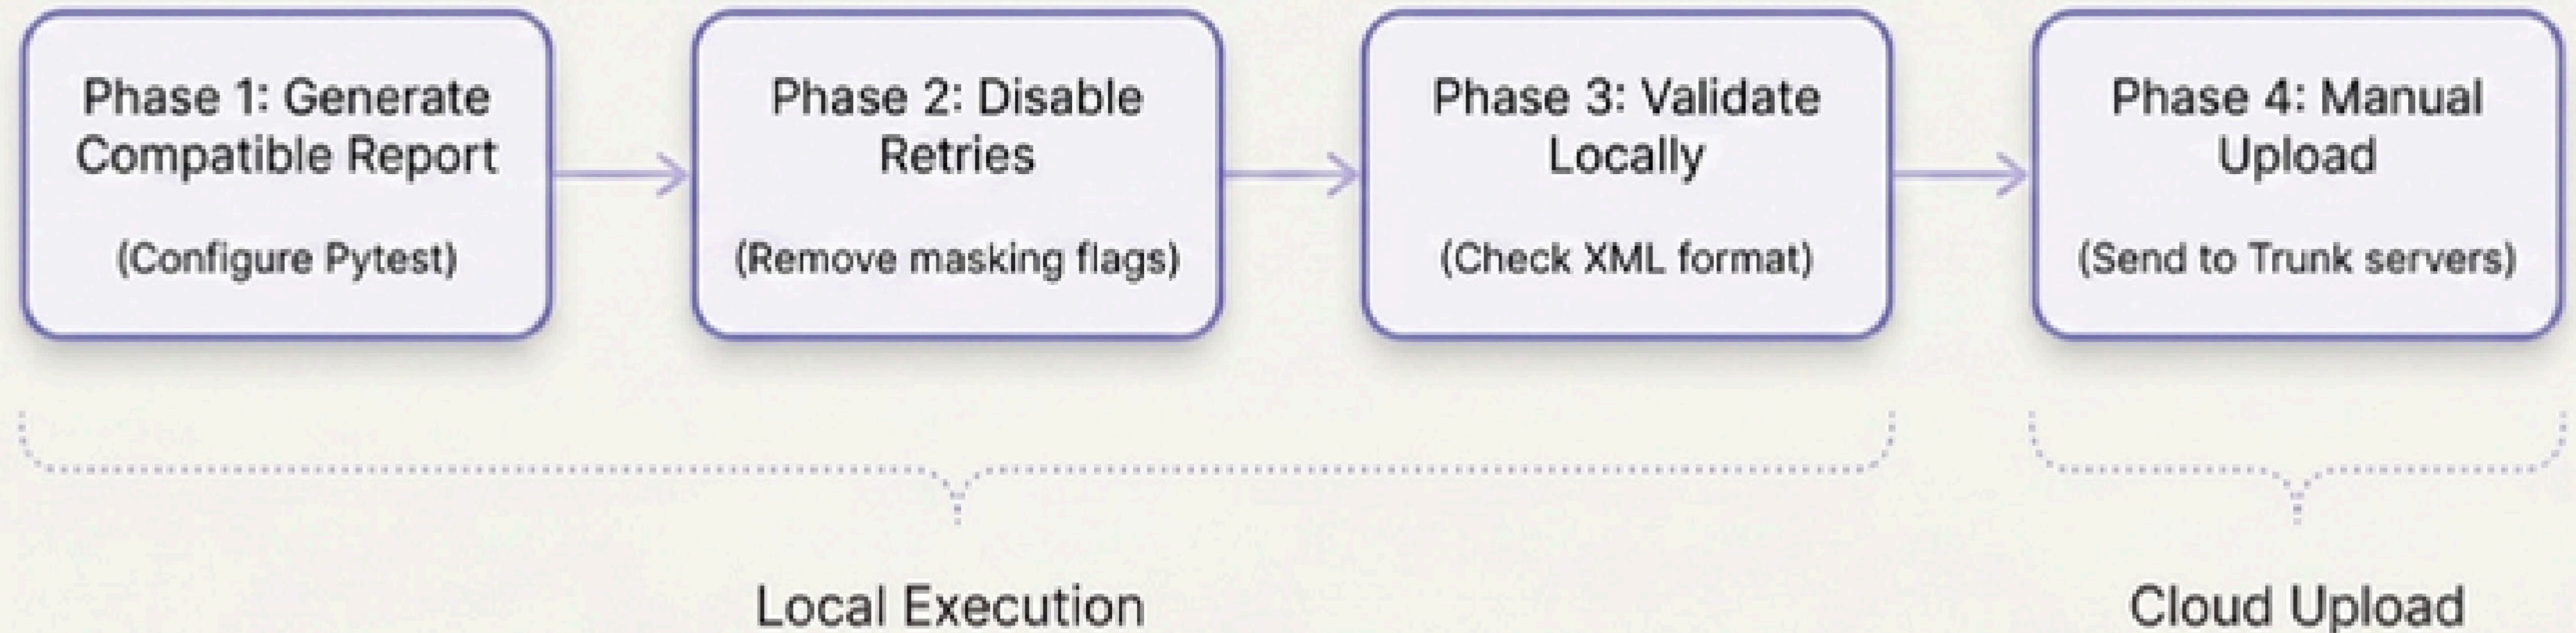

Definition

Flaky Tests intermittently pass and fail without any code changes.

Resolution

Trunk Platform analyzes JUnit XML histories to detect and quarantine these tests, preventing them from breaking the CI build.

The Trunk integration pipeline

Configuring Pytest for strict path mapping

```
pytest --junit-xml=junit.xml -o junit_family=xunit1
```

Exports test results into an industry-standard XML file.

Critical: Forces specific legacy formatting. Embeds exact file paths needed to map failures to code owners and Jira integrations.

Disable `--lf` or `--ff` retry flags. Automatic retries mask instability and compromise accurate flaky test detection.

Validating and uploading reports locally

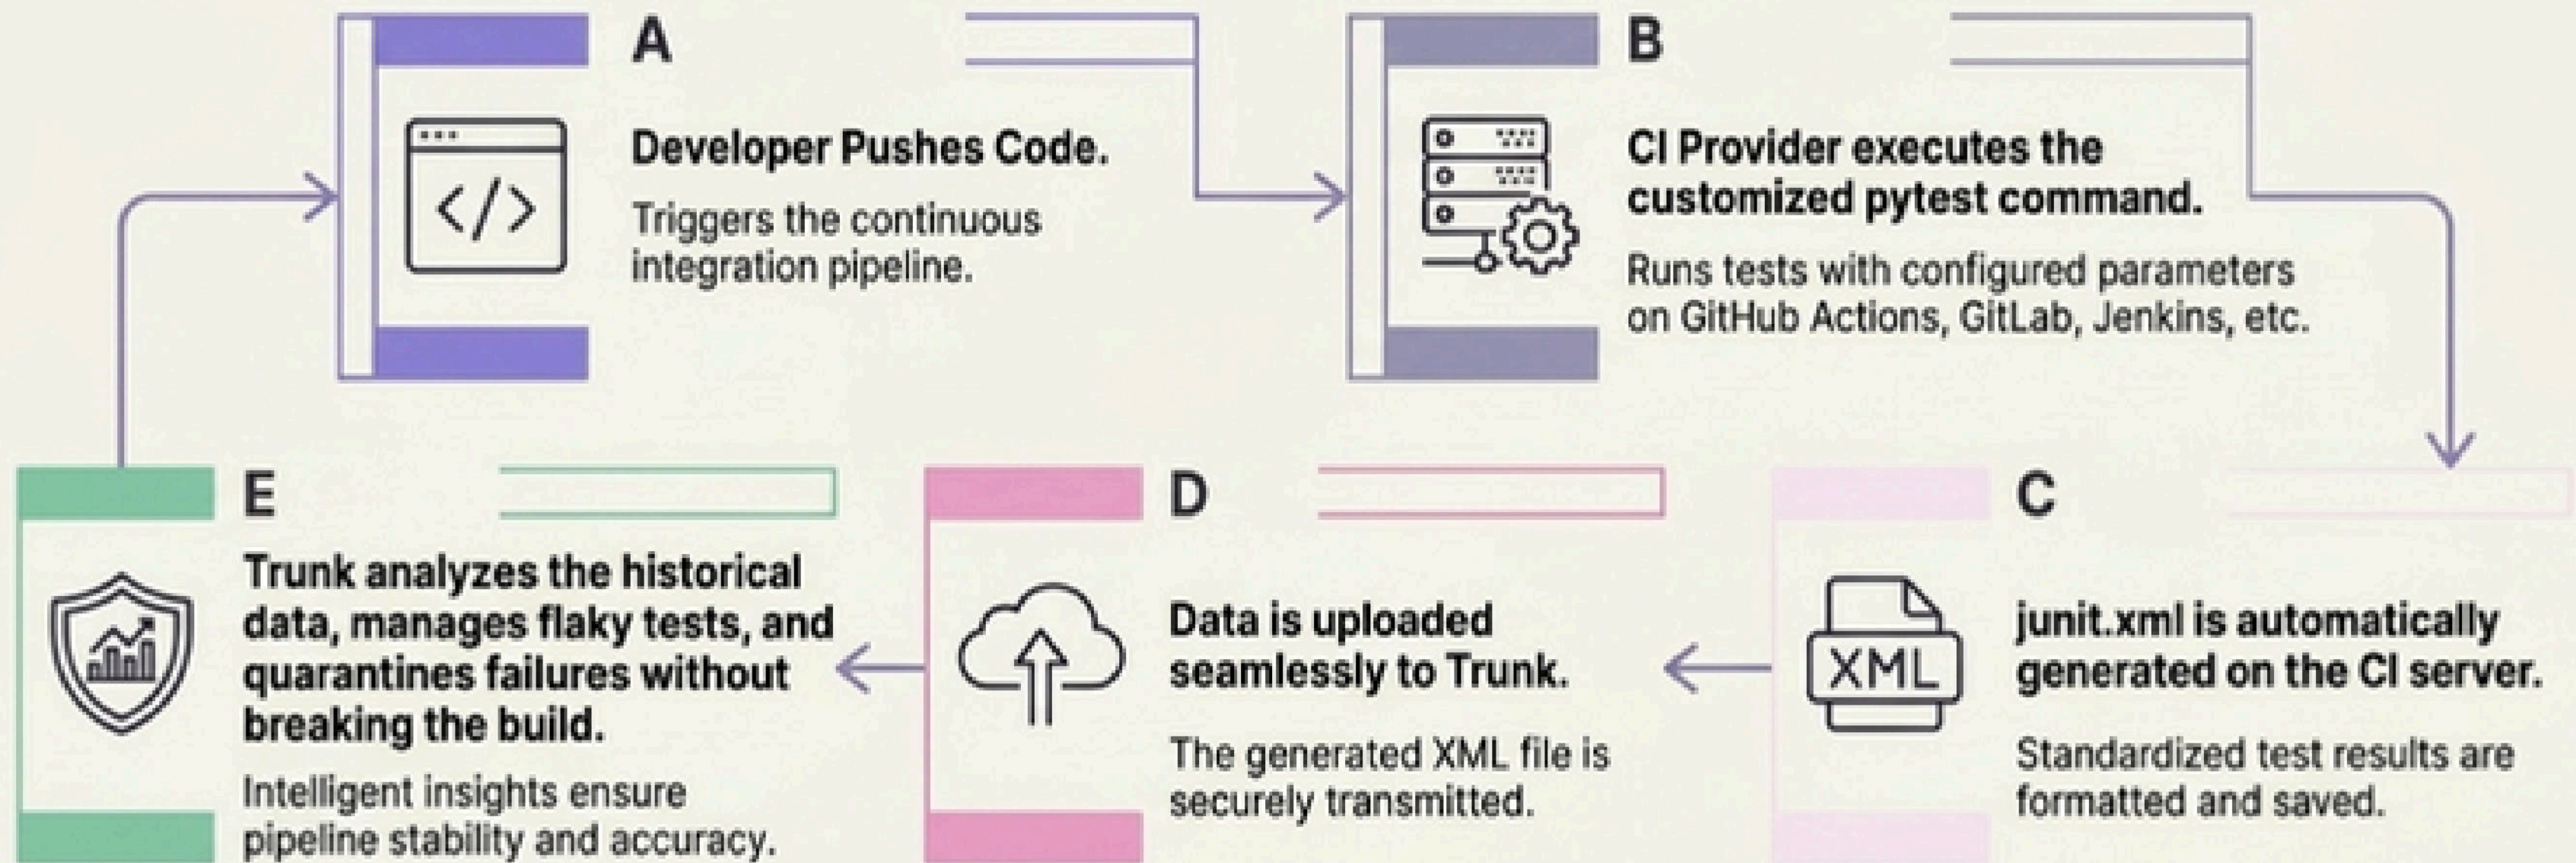

```
./trunk-analytics-cli validate  
--junit-paths "./junit.xml"
```

Catches formatting errors locally before sending data to Trunk servers.

```
./trunk-analytics-cli upload  
--junit-paths "./junit.xml" \  
--org-url-slug  
<TRUNK_ORG_URL_SLUG> \  
--token <TRUNK_ORG_TOKEN>
```

Pushes data. Success is verified in the "Uploads" tab of the Trunk web application.

The complete continuous integration workflow

Next Phase: Drop these validated commands directly into your CI Provider configurations.
